

# Moving Hawai'i

# Beyond Oil

toward a future powered by positive energy

## Trend:

As we adopt more renewables, we're burning less oil to produce the electricity we need. But the pace of progress is slow.

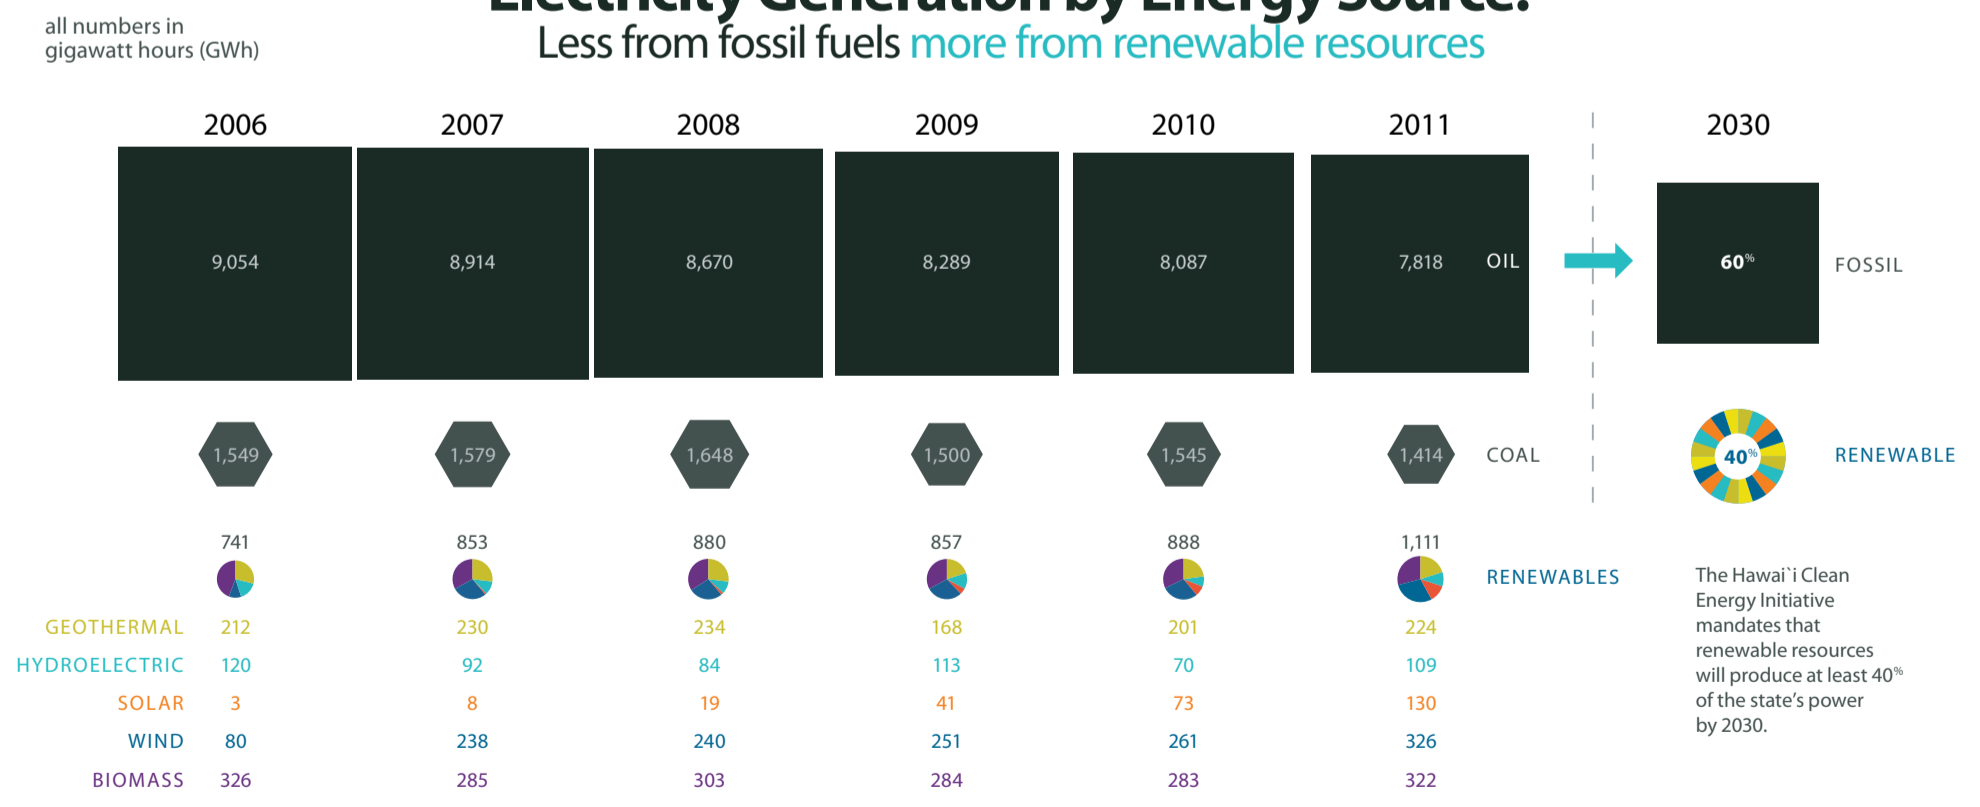

Hawai'i consumes more than 5 million gallons of oil a day, about 58.4 gallons per second.

In 2011, Hawai'i spent more than \$5 billion on imported oil.

Hawai'i residents pay the highest electricity rates in the U.S., more than double the national average.

## Electricity Generation by Energy Source:

Less from fossil fuels more from renewable resources

Solar and wind are the two fastest-growing sources of renewable energy in Hawai'i.
